

Zomato Customer Analytics Dashboard

Presented by Edward Garibay

Overview

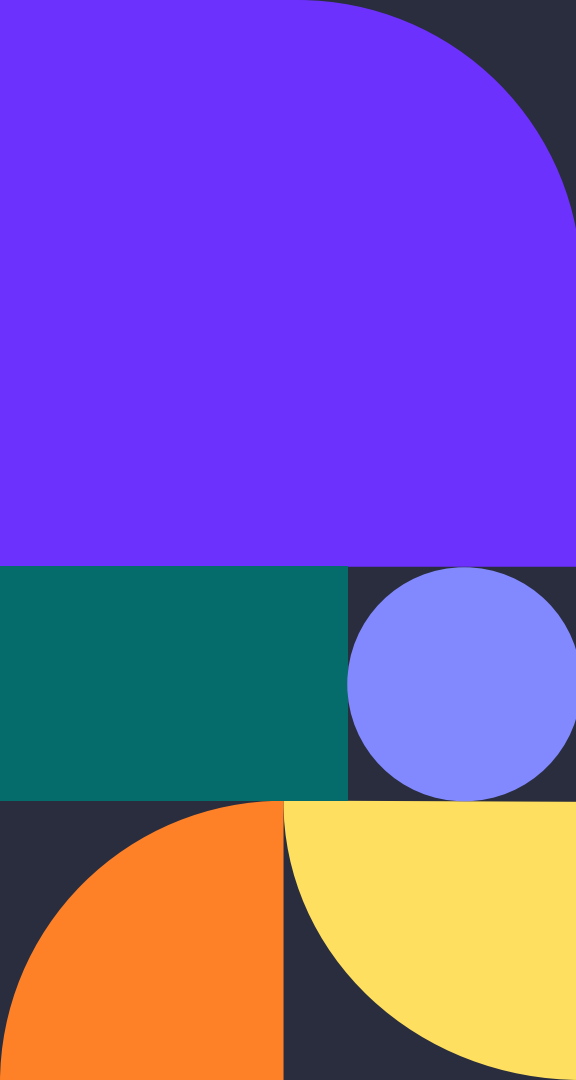

This project focuses on the analysis of Zomato's customer base and their users' purchase behavior patterns through two segmentation techniques:

- RFM customer analysis segmentation
- Demographic customer analysis segmentation.

The goal was to identify who are Zomato's customers in terms of gender, age, income, occupation, and educational level to apply targeted marketing. The RFM analysis would provide insights on which customer segments the marketing team should focus their attention in order to improve the business performance and reduce churn rates.

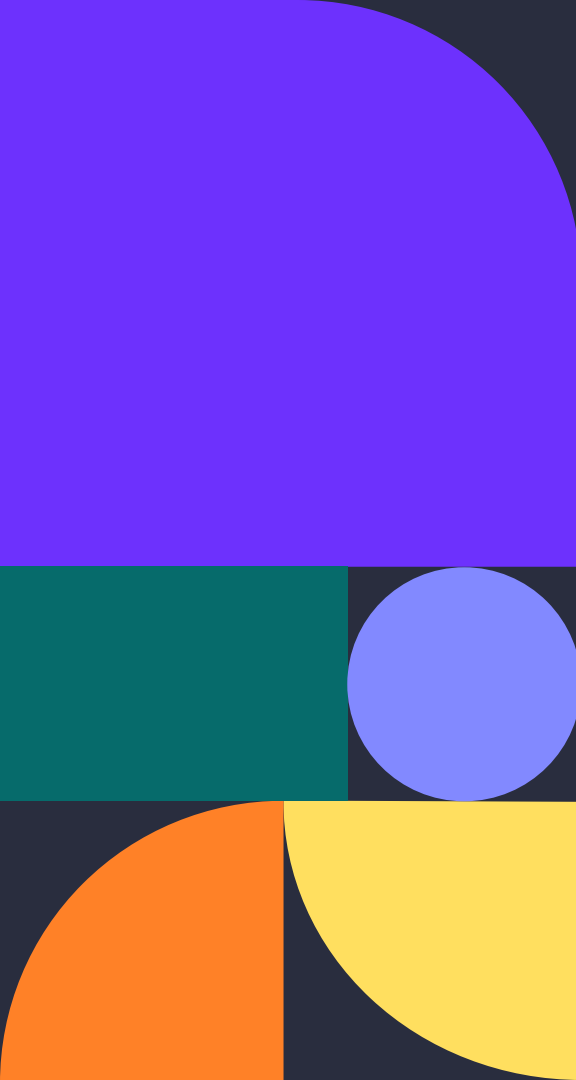

Who is Zomato?

Zomato is a multinational restaurant aggregator and food delivery company.

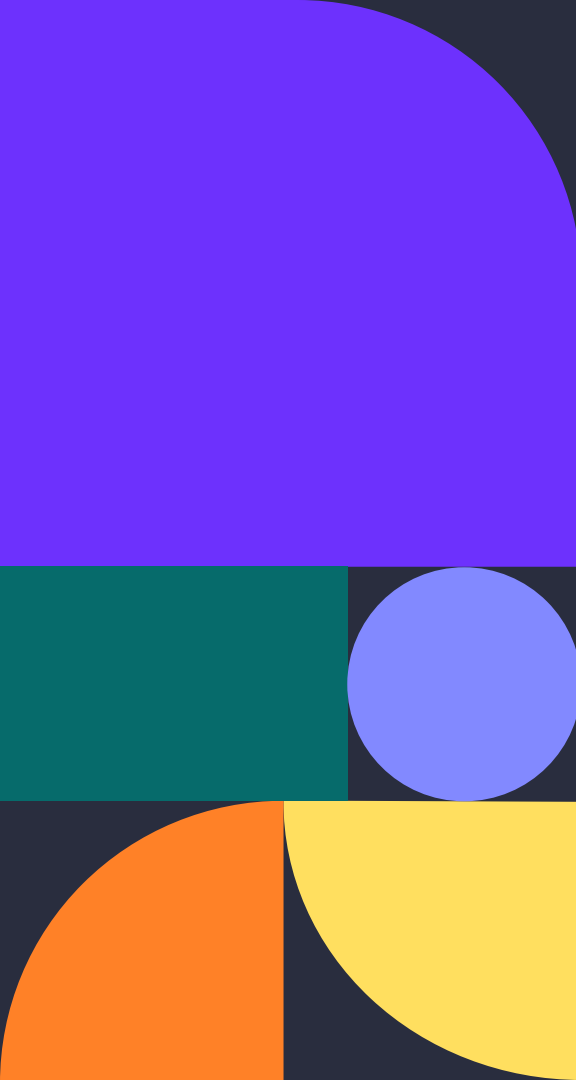

Executive Summary

This analysis explores customer behavior, demographics, and segmentation to uncover patterns that impact loyalty and sales. Our insights suggest that young adult customers (ages 25-30) are the highest contributors to revenue, yet many fall outside of key loyalty segments. Targeting specific at-risk and emerging segments offers a significant opportunity to increase customer retention and drive repeat purchases

Business Questions

- **Who are our most valuable customers?**
- **What do customer demographics reveal about loyalty and sales trends?**
- **Which segments are at risk of churning?**
- **How can we tailor strategies to boost loyalty and retention?**

Demographic Segmentation Dashboard

This dashboard provides information on distinct customer segments based on the following:

- Demographic factors, including age, gender, education level, occupation, family size and marital status.
- Business-related factors, including Total customers, Total Revenue, Average Revenue Per Customer, Average Purchase Value, and Total Quantity Sold
- Trend analysis of monthly purchase frequency to identify seasonality in purchase behavior.
- A comparison between sales quantity vs. sales amount based on customers' age

Customer Demographics

- **Majority of users are aged 21–35**
- **Gender breakdown: 58% Male, 42% Female**
- **Marital Status: 69% Single**
- **Family Size: Avg. 3.1 members**

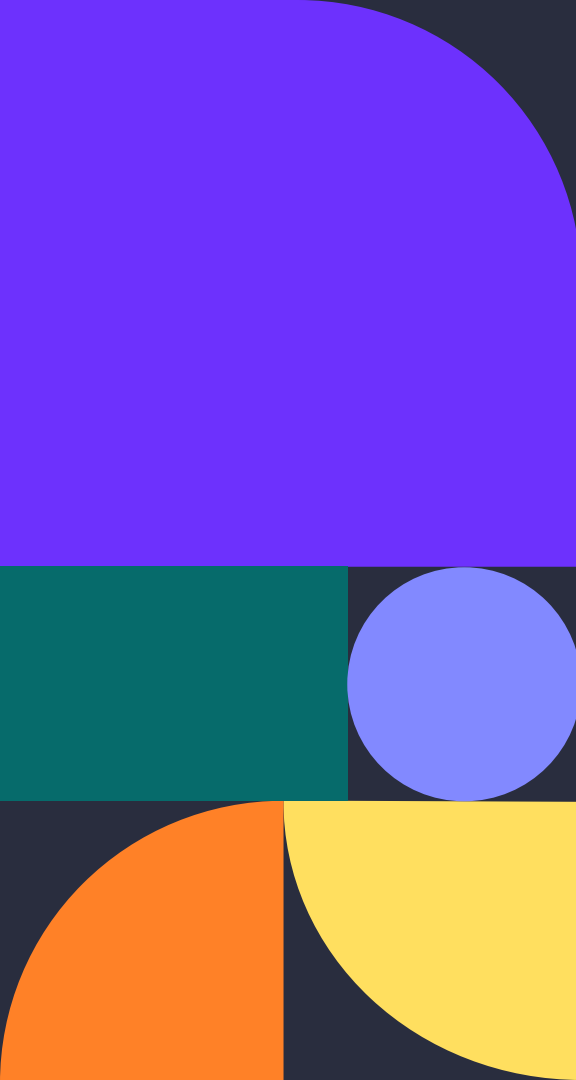

Insight: Single young adults dominate the customer base. High potential for brand loyalty if targeted with relevant offers.

Education & Income Analysis

- Most users hold a graduate or postgraduate degree
-
- 32% of users report "No Income" — mostly students or early

Insight: Despite low income, graduate/post grad users show high engagement and volume. A low-price, high-frequency strategy could resonate with this segment.

RFM Customer Segmentation Dashboard

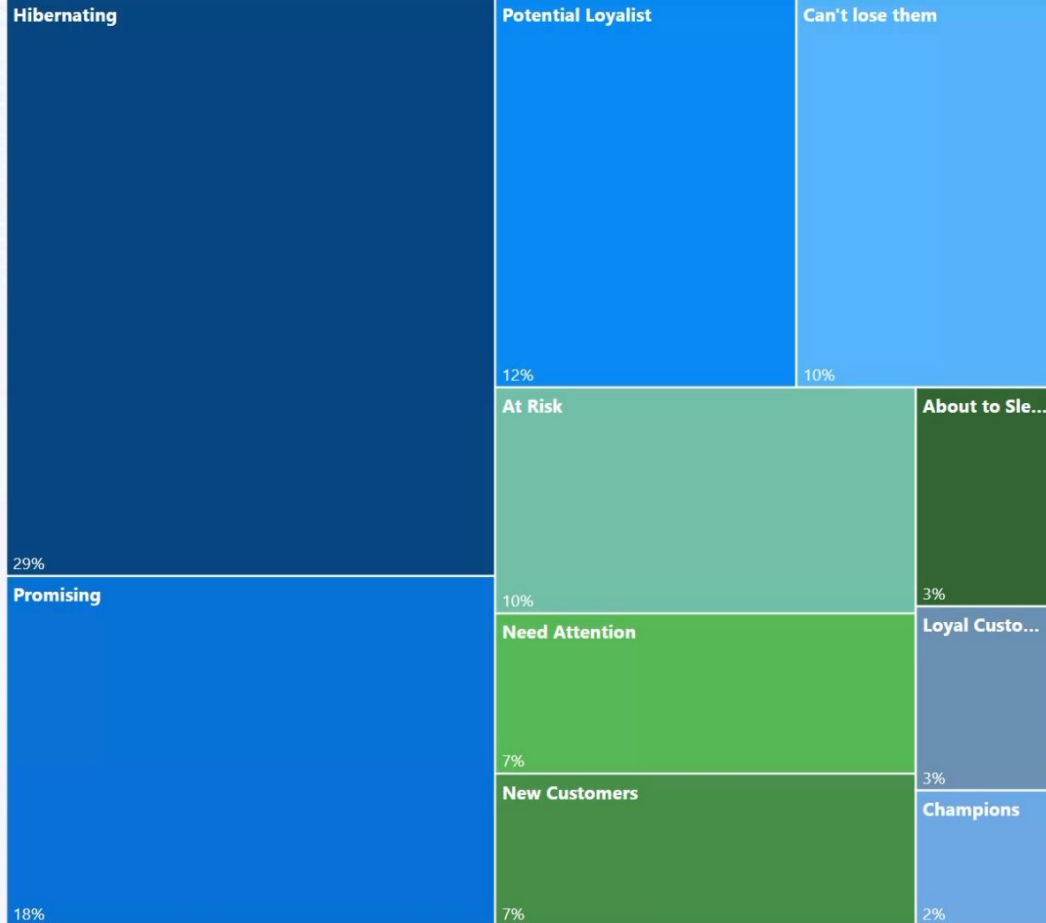

This dashboard provides information on customer segmentation based on the RFM analysis.

Customers are grouped in categories based on the scores associated to their recency, frequency, and monetary values, describing purchase behavior patterns.

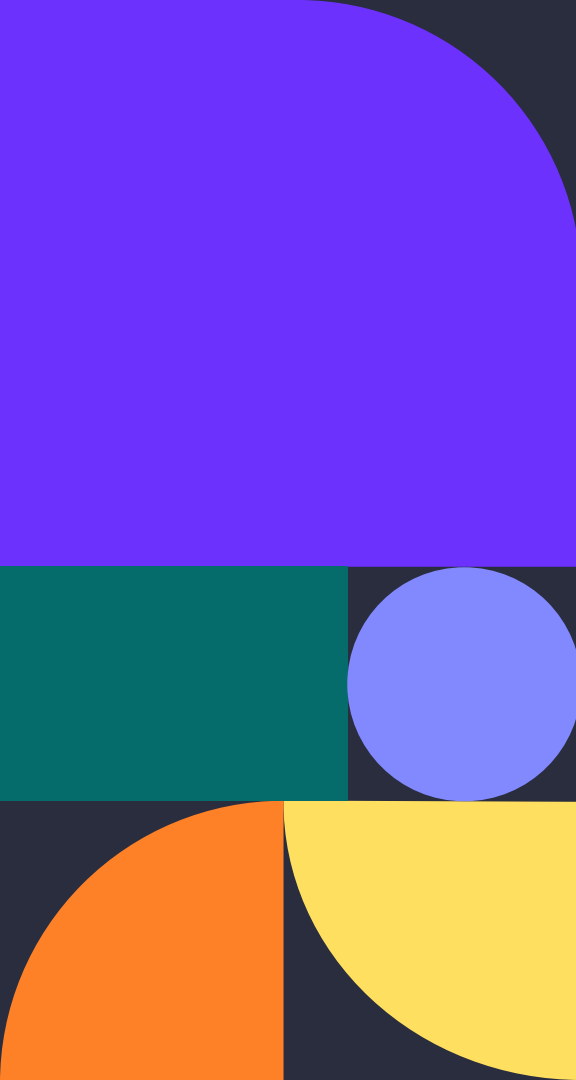

This customer segmentation is made out of nine categories, from Champions to At Risk

- Treemap: represent each customer segment.

Customer Segmentations

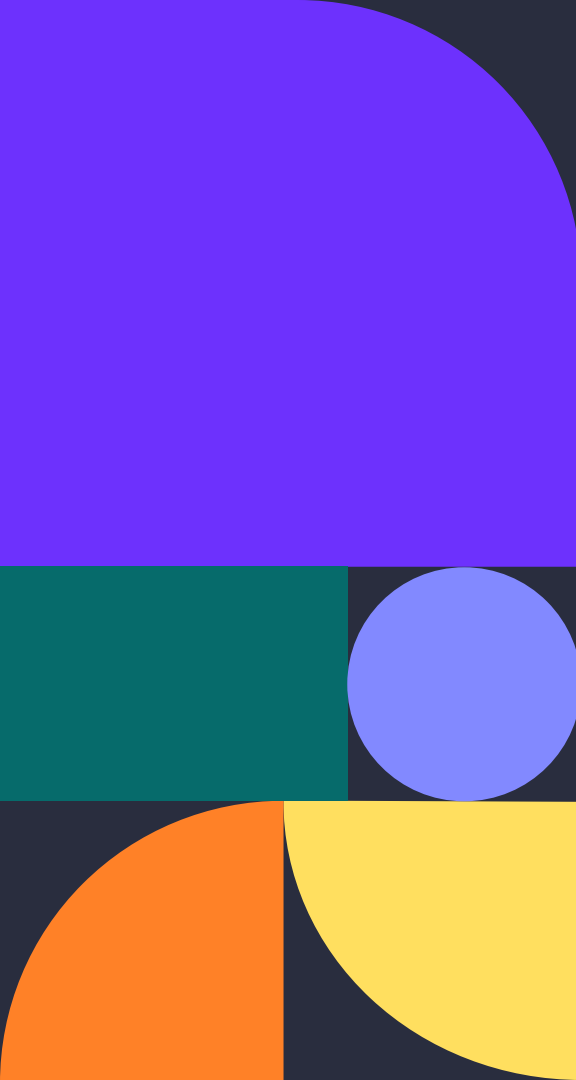

Segment	Recency Score	Frequency Score	Monetary Score	Description
<u>Champions</u>	4-5	4-5	4-5	Recent, frequent, and high spenders. Likely to advocate and refer others.
<u>Loyal Customers</u>	3-5	4-5	3-5	Buy regularly, responsive to loyalty rewards.
<u>Potential Loyalist</u>	3-4	3-4	Any	Recent buyers with some frequency, could convert to loyalists.
<u>New Customers</u>	5	1-2	Any	First-time or very recent customers.
<u>Promising_</u>	4-5	1	Any	Engaged recently but minimal frequency so far.
<u>Need Attention</u>	2-3	2-3	Any	Showing early signs of disengagement.
<u>About to Sleep</u>	3	1	Any	Less frequent, not recent — may churn soon.
<u>Can't lose them</u>	1-2	4-5	Any	Previously loyal, not recent — worth re-engaging.
<u>At Risk</u>	1-2	2-3	Any	Moderate activity in the past, but recently disengaged.

Customer Segmentation Tree Based on RFM segmentation:

- The largest groups are Hibernating (29%), Promising (18%) and Potential Loyalist (12%) which suggest they are prime candidates to be converted into champions
- Only 2% are Champions
- 20% of our customers are At Risk and Can't Lose them, which gives an area to focus on how to generate new interest from these customers

Summary of Findings

Ages 19–25 generate the highest revenue and make up a majority of the champions segment. Given the low percentage of the total champions segment suggests room for improvement in our nurturing campaigns.

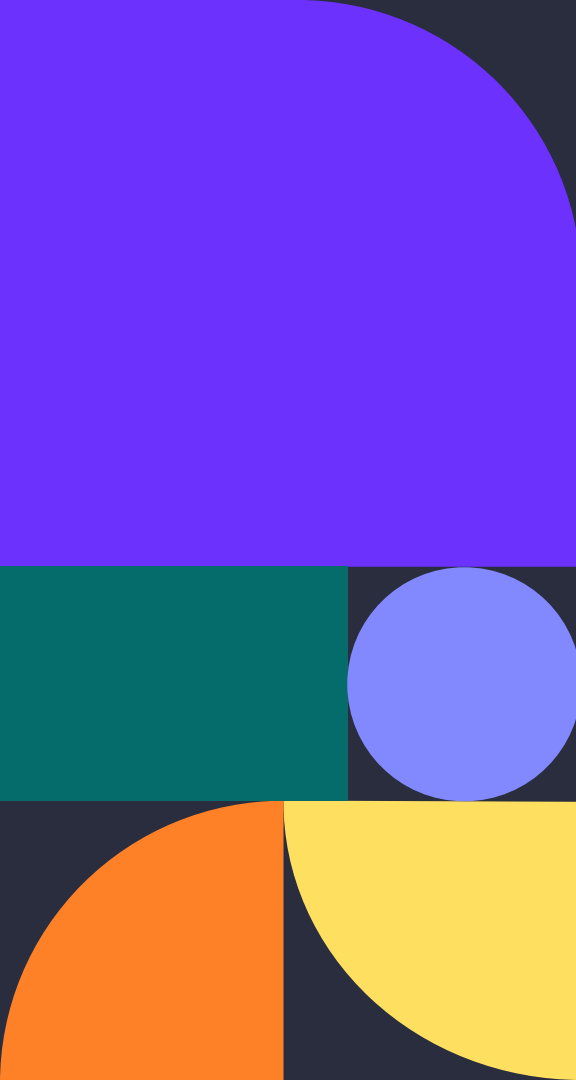

Majority of Users in Hibernating, Promising, or At Risk segments are in between family sizes of 2–4. This can be an area of opportunity to engage them with meal deals and bundle promotional campaigns.

Majority of Customers reported No Income or Under \$50k

There is a gap in gender usage with Men being 58%, showing opportunity to engage the female demographic

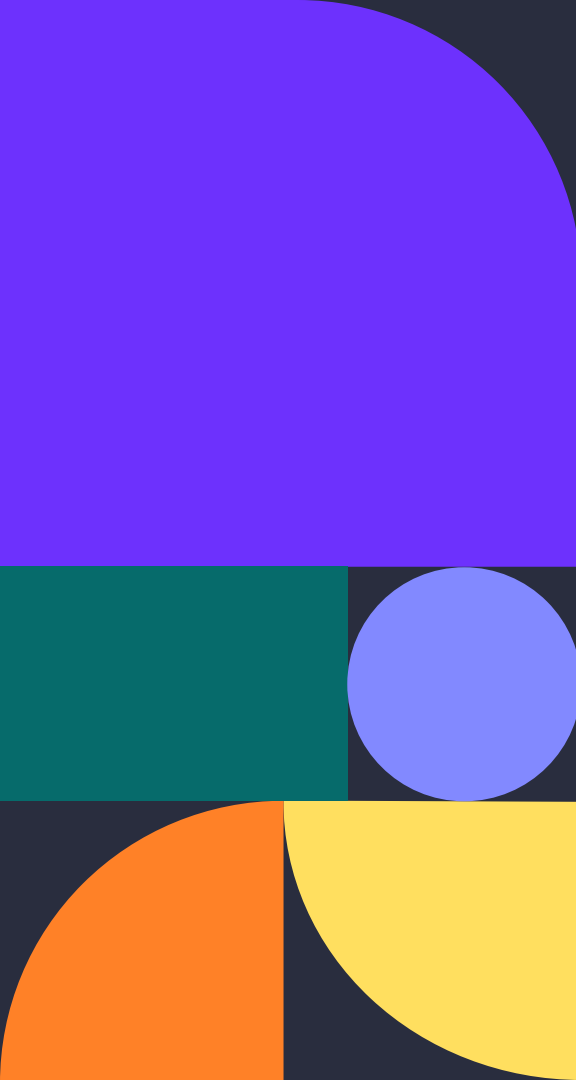

There are spikes in the months of August and December showing Seasonality Trends and opportunity to create engagement in the summer months where frequency drops

These insights suggest targeted engagement and retention strategies to move customers into higher-value segments, while focusing on at-risk groups.

Recommendations

1. Launch promo campaigns for "Hibernating" "Promising" and "Potential Loyalist" segments to push them into loyalty tiers.
2. Create re-engagement offers for "At Risk" users aged 22-26 (e.g., personalized discounts).
3. Develop budget-friendly bundles for "No Income" and student users to drive upsell.
4. Segment and target female users with incentives to boost loyalty conversion
5. Use in-app notifications to celebrate milestones and encourage repeat orders.

Next Steps

- Explore churn prediction models using time-series behavior.
- Incorporate location-based segmentation for hyperlocal campaigns.
- Deep-dive into "New Customers" to understand early churn causes.
- Integrate marketing campaign response data to assess effectiveness.
